DETAILED ACTION

1. Claims 1-3 have been examined.

2. Acknowledgement of papers filed: amendment on 7/14/2005. The papers filed have been placed on record.

Withdrawn Claim Rejections

3. Applicant, via amendment, has overcome the 35 U.S.C. 112, 1st paragraph rejections to claims 1-3 set forth in the previous Office Action. Consequently, these rejections have been withdrawn by the examiner.

New Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. Claims 1-3 are rejected under 35 U.S.C. 103(a) as being unpatentable over Auslander, EPO 0 130 381, in view of Mahlke et al., "A Comparison of Full and Partial Predicated Execution Support for ILP Processors", herein referred to as Mahlke.
- 6. As per claim 1, Auslander teaches a method for processing conditional instructions in a processor with pipeline architecture, the method comprising:

Art Unit: 2183

a. Loading and decoding a processor the processor instruction containing an instruction opcode (bits 0-6), register addresses (bits 11-16, RA), a relative jump distance (bits 16-31, D field), and a post-condition (bits 6-11, BI), which specifies that a conditional jump is to be processed and the corresponding flag bits of an arithmetic-logic unit are to be checked: [Page 33, both the Branch True and Branch False, D-form, instructions.]

Page 3

- b. And jumping to a jump address as a function of the relative jump distance contained in the processor instruction if the post-condition is fulfilled and the checked flag bits are set: [Page 33, if the post-condition is fulfilled when the specified bits are checked, the branch is taken, i.e., the PC is updated by adding the D field to the current PC.]
- 7. Auslander fails to teach wherein the instruction contains a precondition, which specifies under which conditions the instruction is actually to be executed, and the step of the execution of the decoded processor instruction if the precondition is fulfilled.
- 8. However, Mahlke teaches wherein every instruction contains an additional source operand to hold a predicate specifier (precondition) (Page 139, left column, lines 1-3). If the precondition is true, the instruction is executed, however if it is false, the instruction is not executed. (Page 139, right column, 3rd full paragraph). Mahlke also teaches that using the predicated method in place of a large portion of branch instructions (i.e., not all) improves processor performance significantly (Page 139, left column, first full paragraph). It is therefore inherent that there are some unconverted branch instructions that contain a predicate specifier (precondition). Also, a predicated

Art Unit: 2183

branch instruction is shown in figure 3, under heading 'fully predicated code' and subheading 'branch instructions'. Predicating instructions is a well-known method in the art that allows improved processing by not stalling the pipeline while a branch instruction is evaluated. Instead, the instructions that are dependent on the branch instruction contain predicates, and they are executed as normal, except their results are not committed. When the predicate contains a valid value, the instructions from the correct execution path are committed while the other instructions and results are simply ignored. (See 1 Introduction, Mahlke, page 138).

Page 4

- 9. The combination of the full predication of Mahlke and Auslander would result in a branch instruction (conditional jump instruction) with a precondition (predicate specifier) and post-condition (c). It would have been obvious to one of ordinary skill in the art to add the full predication of Mahlke to the instruction processing of Auslander because of the improved processing performance it offers. (Mahlke, page 138, Abstract, final sentence).
- 10. As per claim 2, Auslander, in view of Mahlke, teaches the method as claimed in claim 1, in which the post-condition comprises a plurality of post-condition bits that are checked in the processor: [Branch True or Branch False (page 33) instructions can specify a post condition bit from a Condition Register or General Purpose Register which is made up of a plurality of post condition bits that can be checked. Table 1(a), page 20 depicts the condition register.]

11. As per claim 3, Auslander teaches an apparatus for processing conditional jump instructions in a processor with pipeline computer architecture, the apparatus comprising:

-An instruction decoder (paragraph 3, left column, page 5) for decoding a processor instruction (Branch True or Branch False instruction, page 33) that contains an instruction opcode (bits 0-6), register addresses (bits 11-16, 'RA' field), relative jump distance (bits 16-31, "D" field), and a post-condition, which specifies that a conditional jump is to be processed and the corresponding flag bits of an arithmetic-logic unit are to be checked: ('bits 6-11, "BI" field): [Page 33]

-Wherein the instruction decoder (BR/TRAP Testing unit 52, page 40, line 33 to page 41, line 3 and fig. 2B) is operable to check, whether the post-condition is fulfilled and the flag bits are set, if positive driving a program counter for forming a jump address as a function of the relative jump distance contained in the processor instruction: [Page 33, if the post-condition is fulfilled when the specified bits are checked, the branch is taken, i.e., the PC is updated by adding the D field to the current PC.]

12. Auslander fails to teach the processor instruction containing a precondition, which specifies under which conditions the instruction is actually to be executed, and the instruction decoder is operable to check, in the case of a fulfilled precondition, whether the post-condition is fulfilled and, in the case of a fulfilled post-condition, driving a program counter for forming jump address as a function of the relative jump distance contained in the processor instruction.

Art Unit: 2183

However, Mahlke teaches wherein every instruction contains an additional 13. source operand to hold a predicate specifier (precondition) (Page 139, left column, lines 1-3). If the precondition is true, the instruction is executed, however if it is false, the instruction is not executed. (Page 139, right column, 3rd full paragraph). Mahlke also teaches that using the predicated method in place of a large portion of branch instructions (i.e., not all) can improve processor performance significantly (Page 139, left column, first full paragraph). It is therefore inherent that there are some unconverted branch instructions that contain a predicate specifier (precondition). Also, a predicated branch instruction is shown in figure 3, under heading 'fully predicated code' and sub-heading 'branch instructions'. Predicating instructions is a well-known method in the art that allows improved processing by not stalling the pipeline while a branch instruction is evaluated. Instead, the instructions that are dependent on the branch instruction use predicates, and the instructions are executed as normal, except their results are not committed. When the predicate contains a valid value, the instructions from the correct execution path are committed while the other instructions and results are ignored or discarded. (See 1 Introduction, Mahlke, page 138).

Page 6

14. The combination of the full predication of Mahlke and Auslander would result in a branch instruction (conditional jump instruction) with a precondition (predicate specifier) and post-condition (BI), wherein the precondition would prevent the conditional jump instruction from being executed if false. It would have been obvious to one of ordinary skill in the art to add the full predication of Mahlke to the instruction processing of

Art Unit: 2183

Auslander because of the improved processing performance it offers. (Mahlke, page 138, Abstract, final sentence).

Response to Arguments

Applicants arguments filed on 7/14/2005 have been fully considered but they are found moot in view of the new rejections necessitated by Applicant's amendments to the claims and specification, which required further search and consideration.

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

The following is text cited from 37 CFR 1.111(c): In amending in reply to a rejection of claims in an application or patent under reexamination, the applicant or patent owner must clearly point out the patentable novelty which he or she thinks the claims present in view of the state of the art disclosed by the references cited or the objections made. The applicant or patent owner must also show how the amendments avoid such references or objections.

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any

Art Unit: 2183

extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kevin P Rizzuto whose telephone number is (571) 272-4174. The examiner can normally be reached on M-F, 8-4:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Eddie Chan can be reached on (571) 272-4162. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
